

## Benefits

- \* Ingrown hair may cause discomfort, infections and weakness. During shaving scars and wounds occur. Ingrown hair leads to inflammation and skin bumps. Laser hair removal can save you from ingrown hair for a long time.
- \* Laser hair removal can increase your confidence. Your skin can become smoother and healthier. The unpleasant experience of ingrown hair between the waxing procedures or the struggle of using an epilator will become a distant memory.
- \* Long-term laser hair removal is cheaper than waxing, electrolysis or other methods of hair removal; therefore, you can achieve better results at a lower price. Laser hair removal is permanent. You would not need to often repeat the other well-known unpleasant and ineffective hair removal procedures. Put an end to the torture of expensive waxing or electrolysis.
- \* You can continue with your daily routine immediately after the treatment, without any side effects.

Laser Hair Removal

### Is laser hair removal painful and how long does it last?

Laser hair removal is not painful; the patient may feel mild discomfort during the procedure.

### How many treatments will I need?

The number of treatments varies according to every patient. The number of treatments depends on the skin type, the skin color, the size and the structure of the hair, the area of the body being treated, the age of the patient, hormonal background, etc.

Generally, the number of body treatments ranges between 4 and 6 and this for face treatments – between 6 and 12. After one treatment reduction of unwanted hair reaches between 20% and 50%, and after 3-5 treatments – between 80% and 100%.

### Who performs the treatments?

The treatments are performed by a medical doctor and a medical beautician.

### What do we need to know about natural hair growth?

Hair growth has 3 stages: anagen, catagen and telogen. In order for the hair to be destroyed, the follicle must be in the anagen phase and the hair must contain melanin. Hair grows at a rate of one millimeter per 24 hours; therefore for 3-4 days its length increases by 3-4 millimeters.

### How to prepare for laser hair removal?

The hair must be 1 mm long. At least 3 weeks before laser hair removal you must NOT: perform waxing, epilating or hair bleaching, expose your body to artificial UV (solarium) or apply tanning lotion (unless the area is protected with high-SPF sunscreen and is exposed to direct sunlight).

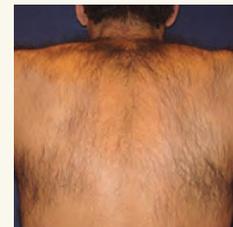

### What is laser hair removal?

The procedure of laser hair removal involves absorption of radiated light by the pigment in the hair follicles and its transformation into thermal energy, which leads to their death. Thus the light selectively affects hair structures without damaging the surrounding skin. After completing the main course of treatments the reduction of unwanted hair reaches 80% to 90%.
